                                                                                                                   The present Hequence represents the light chain varaible region of murine antibody Act-1. Act-1 is active against human alpha4-beta7 integrin. Musicosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of th.s particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high andothalial 'emules in mucosal lymph nodes. Humanised Act-1 can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting diseases such as inflammatory bowel diseases. The immunoglobulin can also be used for detection, isolation and diagnosis.

The present sequence represents the consensus amino acid sequence comprising the variable region of murine Act-1 antibody determined from several independent mouse light chain variable region clones. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadcAw1-) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to madcAw1, which is present of high endothelial venules in mucosal cylmph nodes. Variable regions were amplified from DNA encoding Act-1 using degenerate PCR primers V20083-84. The degeneracy of the PCR primers v20083-84. The degeneracy of the PCR primers consensus sequence. The present sequence was used to construct consensus sequence. The present sequence which contain murine antigen conneric, humanised Act-1 antibodies, which contain murine antigen binding regions. The humanised immunoglobulin can be used to inhibit can be used to inhibit can be used to inhibiting leukcoyte confilteration of tissues, e.g. for treating inflammatory diseases such as inflatmatory bowel disease. The immunoglobulin can also be used for

They are encoded by a 3F4 human 1gG4 expression plasmid insert (see also T62938). A chimeric antibody specific for porcine VCAM can be produced in transfected host cells. It is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human
                                                                                                                                                                                                                                                                                                                                             Antibodies binding to porcine but not human cell interaction proteins - useful to treat and assay for rejection of xenografted porcine organs, tissues or cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MKLPVRLLVLLLFWIPVSGGDVVVTQTPLSLPVSFGDQVSISCRSSQSLAKSYGNTYLSW

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents the light chain of humanised murine multibody Act-1. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadGAM-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadGAM-1, which is present of high endothelial used to inhibit the interaction of cells bearing alpha4-beta7 with cosels bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infiltration of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel disease. The immunoglobulin can also be used for detection, isolation and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 YLHKPGQSPQLLIYGISNRFSGVPDRFSGSGSGTDFTLKISTIKPEDLGMYYCLQGTHQP 120

                                                                                                                                                                                                                                                                                                                                                                                               Lugant cutain (www.sto) and neary untain marson sequences in adhesion provided for the murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAD) 3F4. Hybridoma 3F4 was produced by standard techniques using recombinant, soluble porcine VCAM as immunogen. Chimeric antibodies can be produced by cloning AMD 3F4 and 2A2 (see also W14931-32) variable regions into expression plasmid pAPEX-3P modified to contain the human gamma4 constant region in place of the human gamma1 Cl region. Sequences are provided for 3F4 (chimeric) human GL/G4 coNA (W14940), and 3F4 human IgG4 expression plasmid insert product (W14940), and 3F4 human igG4 expression plasmid insert product (W14941-42). The chimeric antibodies are specific for porcine VCAM. They are useful for diagnosing human regelection of porcine cells, tissues and for improving xenotransplantation of porcine cells, tissues and organs
                                                                                                                                                                                                                                                                                                                 Antibodies binding to porcine but not human cell interaction proteins - seful to treat and assay for rejection of xenografted porcine organs, tissues or cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. This sequence represents the variable kappa chain of the antibody of produced by hybridoma 1-706-139, and can be detected using the method of the invention. The method is for detecting the presence of antibody which can be present in a test sample. It comprises contacting a test sample suspected of containing the antibody with an antigen specific for the antibody to allow the formation of antigen/antibody complexes, detecting the presence of the antibody which may be present in the test sample and employing, as a control or calibrator, a reagent which binds to the cantibody constant region epitopes, where the reagent binds to the antigen and is homogeneous with respect to specificity and affinity. The method can be also be used for detecting the presence of antibodies developed can be also be used for detecting the presence of antibodies developed can be also be used for detecting the presence of antibodies developed contains more than one antigen. The method is used particularly for the detection of human antibodies specific for a given antigen, e.g. HIV-1, hepatitis E virus, rubella virus, etc. Use of the reagents circumwent all coff the problems associated with using an immune sera in the manufacture of the problems associated with using an immune sera in the manufacture coff the problems developed and reproducibly generated in virtually unlimited quantities and are also useful for quantitating, and monitoring the integrity of, the antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä

The present sequence is that of the murine anti-idiotype monoclonal antibody (MAb) 1A7 variable light chain. MAb 1A7 was raised against the anti-ganglioside 2 (GD2) MAb 14G2a, which binds an unique epitope of GD2. As the glycosphingolipid GD2 is expressed at high density by human neuroectodermal tumours, e.g. malignant melanoma, neuroblastoma, glothoma, soft tissue sarcoma and small cell carcinoma of the lung, MAb 1A7, or its CDNA can be used in a vaccine to treat or palliate such diseases. They can also be used to reduce the risk of recurrence of a clinically detectable tumour, and detect an anti-GD2 Ab bound to a tumour cell.

MAb 1A7 overcomes immune tolerance and induces an immune response against GD2, which comprises anti-GD2 Ab (humoraj response) and
                                                                                                                                                                                                                                                       Murine; mouse; anti-idiotype; monoclonal antibody; MAb; 1A7; variable 11ght chain; ganglioside 2; GD2; 14G2a; neuroblastoma; glycosphingollpid; human; neuroectodermal; tumour; glioma; lung; malignant melanoma; soft tises sarcoma; small cell carcinoma; vaccine; treatment; palliate; detection; diagnosis; recombinant production; purification; probe; primer; assay;

The antigen stimulates the generation of anti-idiotype antibodies that neutralize the aberrant immune response anti-idiotype antibodies that neutralize the aberrant immune response causing the psoriasis. The method is used to treat psoriasis, especially chronic plaque, gluttate, pusuluar, plaque-type psoriasis or psoriatic arthritis. The compositions allow the individual's own immune system to act against psoriatic tissue. The present sequence represents the light

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a monoclonal antibody (MAb) designated 1A7, which elicits an anti-GD2 (tumor-associated antigen) immunological response in humans. MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 - associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the light chain variable region of MAb 1A7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monoclonal antibody 1A7 which elicits an anti-GD2 immunological response, useful for the development of products for the detection and treatment of cancers

                                                                                                                                                                                                                                                                    Ĥ
                                                                            This polypeptide is the variable light chain region of monoclonal anti-idiotype antibody 1A7. The polypeptide has three CDRs (complementarity determining regions) and four frame work regions. When administered to an individual the 1A7 antibody induces an immune response against ganglioside GD2. The heavy chain variable region of the 1A7 mantibody (Y28469) is also capable of eliciting an anti GD2 response in mammals. Both the heavy and light chain variable regions of the 1A7 antibody produce anti-GD2 T call and antibody responses. The peptides and antibodies may be useful for the modulation of ganglioside GD2, and neuroblastoma, glioma, soft tissue sarcoma, and small cell carcinoma (including small cell lung cancer).
                                                                                                                                                                                                                                                                                                                          61 YLHKPGQSPQLLIYGISNRFSGVPDRFSGSGSGTDFTLKISTIKPEDLGMYYCLQGTHQP 120

The present invention describes a polypeptide containing the variable region of the light chain of a monoclonal antibody, which induces apoptosis, in nucleated blood cells having integrin associate protein (IAP). Also described are: (1) DNA encoding the novel polypeptide; (2) animal or microbial cells expressing the DNA of (1); and (3) agents for the treatment of blood disorders which contain the polypeptide. The polypeptide can be used in the treatment of blood disorders such as leukaemia. The present sequence represents the plasmid pGRM-NIL mouse MABL-11, chain V region which is given in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoglobulin variable domain; primer; polymerase chain reaction; chimeric antibody; human milk fat globule; human breast carcinoma; murine anti-human carcinoma monoclonal antibody KC-4.
                                                                                                                                                                                                                                                                                              An initial isolation of cDNAs coding for murine anti-human breast carcinome and) KC-4 was performed using PCR with commercially available pr.mers (see 66751-062758, available from NOVAGEN). Subsequent c.oning using PCR primers JO20, JO21, JO22 and JO24 (see 662759-162762) resulted in the isolation of the mouse Ig variable domuins. The amplified cDNAs were sequenced (062763 and 062764) and immino acid sequences were deduced from them. Chimeric mouse-human intibodies were constructed using human constant regions so as to produce less immunogenic polypeptides which retained the anti-human carcinoma binding specificity of KC-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Murine KC-4 immunoglobulin light chain variable region (deduced).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   An initial isolation of cDNAs coding for murine anti-human breast carcinoma MAb KC-4 was performed using PCR with commercially available primers (see Q62776-Q62783, available from NOVAGEN). Subsequent cloning using PCR primers JO20, JO21, JO22 and JO24 (see Q62784-Q62787) resulted in the isolation of the mouse Ig variable domains. The amplified cDNAs were sequenced (Q62788 and Q62789) and amino acid sequences were deduced from them. Chimeric mouse-human antibodies were constructed using human constant regions so as to produce less immunogenic polypeptides which retained the anti-human carcinoma binding specificity of KC-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ĥ
                                                                                                                                                                                                                                                                                                              were prepared by PCK from Dolyadenylated RNA isolated from 100 million KC-4 hybridoma cells. All clones were obtd. from independent PCRs. The sequences of the primers are given in Q87519-Q8756. The sequences of the primers are given in Q87519-Q8756. In the PCR products were cloned, without prior purificn., into pCR1000 (Invitrogen) and sequenced in both directions. The VL DNA sequence and tis derived protein sequences are shown in Q87531 and R70449-R70457. The mature VL chain begins at AA D of framework i (FRI). VL is a group II kappa chain. Part of the CDR3 and all of the FR4 are encoded by JK2. There is a an asparagine glycosylation site in the sequence of R70449-R70456.

The present invention describes a transgenic, non-human animal with its genome altered to constitutively express a molecule having a constant region which can bind an IgE receptor on mast cells in the animals, the molecule having an immunoglobulin structure and being further capable of specifically binding a predetermined antigen. The transgenic animal is substances i.e. with antiallergic activity, to affect any aliesgic reaction caused in the animal by the administration of the antigen to the animal, and applying the substance to be evaluated. The present can mouse immunoglobulin E (IgE) light chain, given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 YLHKPGQSPQLLIYGISNRFSGVPDRFSGSGSGTDFTLKISTIKPEDLGMYYCLQGTHQP 120

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                       695
